

Intent Qualification Methodology

AI Outbound Caller — Build Spec for Developer + CRM Part 0 BRD

1. Overview

Each completed AI outbound call is classified into one qualification band. The post-call AI step extracts factual yes/no signals only — it does not score. The band is computed in code, so the same call always produces the same band and every band is traceable to the signals behind it.

Why this replaces the weighted intent-score model: the prior model scored buyer enthusiasm (urgency, dealer-initiated questions, stated timelines) and explicitly discounted an agent-offered callback. On cold outbound B2B calls real dealers rarely behave that way, so genuine fits were mis-classified as Cold. This model scores call progression, with the callback as the qualifying event.

2. Post-call extraction prompt

Drop this into the post-call analysis step (gpt-4o). The model returns facts only; score and band are derived downstream.

You are analysing a transcript of an outbound sales call between iTarang's AI agent and a battery dealer. The agent pitched EV batteries and a financing scheme.

Extract ONLY what the dealer actually said or did. Do not infer intent, do not score, do not be generous. If a signal is not clearly present, mark it "no".

Return STRICT JSON only - no preamble, no markdown, no explanation:

```
{
  "relevant_dealer":      "yes" | "no",
  "dealer_segment":      "battery" | "e_rickshaw" | "e_2w" | "multiple" |
  "none",
  "dealer_role":          "oem" | "dealer" | "both" | "unknown",
  "battery_spec_shared":  "yes" | "no",
  "volume_shared":        "yes" | "no",
  "existing_financier_shared": "yes" | "no",
  "financing_need_expressed": "yes" | "no",
  "financing_value_acknowledged": "yes" | "no",
  "pitch_heard":          "yes" | "no",
  "callback_agreed":      "yes" | "no",
  "disqualifier":         "none" | "dont_call" | "hostile" | "not_interested" |
  "call_dropped",
  "evidence": {
    "relevant_dealer":      "<short quote/paraphrase>",
    "battery_spec_shared":  "<capacity / voltage / Ah / chemistry stated>",
    "volume_shared":        "<units per month or business volume stated>",
    "existing_financier_shared": "<financier/NBFC named, or 'none'>",
    "financing_need_expressed": "<what he said about needing financing>",
    "financing_value_acknowledged": "<what he said about financing helping business>",
    "callback_agreed":      "<the line where they agreed>"
  }
}
```

Each signal below must be a FACT the dealer stated, not an impression. Mark "yes" only on explicit disclosure - never infer from tone.

Rules for each field:

- relevant_dealer batteries,	= yes if he manufactures, assembles, sells, OR trades e-rickshaws, OR electric two-wheelers (any one qualifies);
- dealer_role resells it,	capture which in dealer_segment. = oem if he makes/assembles the product, dealer if he both if applicable, else unknown. Context only - no
band impact. - battery_spec_shared	= yes if he states the battery capacity he works on (voltage / Ah, e.g. 48V/60V/72V, 100Ah, lithium/lead-
acid). - volume_shared	= yes if he gives a number: units per month, or business volume / turnover.
- existing_financier_shared with	= yes if he names/confirms a financier or NBFC he works (or explicitly states he uses none).
- financing_need_expressed battery	= yes if he says he needs financing, or that rising prices make financing necessary.
- financing_value_acknowledged	= yes if he agrees financing would grow / improve his business.
- pitch_heard finance	= yes if he stayed on the line through the battery + pitch without cutting it off.
- callback_agreed theek hai"	= yes if he agreed to a follow-up call; a passive "ok / to an agent-offered callback COUNTS as yes.
- disqualifier (abusive),	= dont_call (asked not to be called again), hostile not_interested (firm no after pitch), call_dropped (the
call	ended before its natural close), else none.

Note: info_signals_count = number of these five marked yes - battery_spec_shared, volume_shared, existing_financier_shared, financing_need_expressed, financing_value_acknowledged. The band is computed in code from this count.

3. Band rule (computed in code)

```
# How many objective facts the dealer disclosed (0-5)
info_signals_count = count_yes([
    battery_spec_shared, volume_shared, existing_financier_shared,
    financing_need_expressed, financing_value_acknowledged
])

# A dropped call only voids the lead if NOTHING was captured
if disqualifier == "call_dropped":
    if info_signals_count == 0 and callback_agreed == "no":
        return { band: None, call_status: "dropped_empty", action: "auto_retry" }
    call_status = "dropped_partial" # substance captured before the drop
else:
    call_status = "complete"

# Banding - top rule wins (runs for complete AND dropped_partial calls)
```

```

if relevant_dealer == "no":
    band = "Disqualified" # not in our market
elif disqualifier in ["dont_call", "hostile", "not_interested"]:
    band = "Disqualified"
elif callback_agreed == "yes" or info_signals_count >= 3:
    band = "Qualified" # commitment OR enough disclosed substance
elif info_signals_count >= 1:
    band = "Warm"
else:
    band = "Cold" # heard pitch, disclosed nothing

# dropped_partial leads are tagged "resume - call was cut off" for inside-sales
# Queue order = info_signals_count desc (more facts disclosed = higher priority)

```

4. CRM handoff mapping

Band	interest_level	lead_score	Action
Qualified	hot	90	Push to inside-sales queue (sort by info_signals_count desc)
Warm	warm	60	Schedule a retry call
Cold	cold	30	Nurture / re-attempt later
Disqualified	—	—	Drop
(dropped, nothing captured)	—	—	Auto-retry, no band written

5. Replacement intent section — CRM Part 0 BRD

Section X — Intent Qualification *(replaces the weighted intent-score model)*

Purpose

Classify each completed AI outbound call into a qualification band so that genuine battery dealers reach the inside-sales team and the rest are correctly nurtured or dropped.

Why this replaces the weighted model

The prior model scored buyer enthusiasm and discounted agent-offered callbacks, so real dealers on cold calls were mis-classified as Cold. This model scores call progression using factual yes/no signals, with the callback as the qualifying event.

Method

The post-call AI step extracts the signals below as facts only. The band is then computed deterministically in code — same call, same band; every band traceable to the signals that produced it.

Extracted signals

Signal	Values	Definition
relevant_dealer	yes / no	Dealer manufactures, assembles, sells, or trades batteries, e-rickshaws, or electric 2-wheelers (any one qualifies)
dealer_segment	battery / e_rickshaw / e_2w / multiple / none	Which market the dealer is in — context + routing; does not affect the gate
dealer_role	oem / dealer / both / unknown	Whether he manufactures or resells — context + routing; does not affect the gate
battery_spec_shared	yes / no	States the battery capacity he works on (voltage / Ah / chemistry)
volume_shared	yes / no	Gives a number — units per month or business volume / turnover
existing_financier_shared	yes / no	Names or confirms a financier / NBFC he works with (or states none)
financing_need_expressed	yes / no	Says he needs financing, or that rising battery prices make it necessary
financing_value_acknowledged	yes / no	Agrees financing would grow / improve his business
pitch_heard	yes / no	Stayed through the battery + finance pitch
callback_agreed	yes / no	Agreed to a follow-up call — passive agreement counts
disqualifier	none / dont_call / hostile / not_interested / call_dropped	Hard negative signals

Qualification depth = info_signals_count — the number of these five financing/business facts marked yes: battery_spec_shared, volume_shared, existing_financier_shared, financing_need_expressed, financing_value_acknowledged. Range 0-5. It both qualifies the dealer (≥ 3) and orders the Qualified queue.

Band logic (top rule wins)

#	Condition	Band
0	call_dropped AND info_signals_count = 0 AND callback_agreed = no	No band — auto-retry
1	relevant_dealer = no	Disqualified (not in our market)

#	Condition	Band
2	disqualifier ∈ {dont_call, hostile, not_interested}	Disqualified
3	callback_agreed = yes OR info_signals_count ≥ 3	Qualified
4	info_signals_count = 1 or 2	Warm
5	pitch heard, info_signals_count = 0	Cold

Dropped calls. call_dropped is conditional, not absolute. If the line drops before anything is captured (info_signals_count = 0 and no callback), the lead is voided and auto-retried (call_status = dropped_empty). If substance was already captured before the drop, the call is banded normally on what was disclosed and tagged call_status = dropped_partial — inside-sales sees a “resume — call was cut off” note instead of a cold retry. A completed call is call_status = complete.

Routing & CRM handoff

Band	interest_level	lead_score	Action
Qualified	hot	90	Inside-sales queue, ordered by info_signals_count (0-5)
Warm	warm	60	Schedule retry call
Cold	cold	30	Nurture / re-attempt
Disqualified	—	—	Drop

Worked example

Dealer A states 12-15 units/month (volume_shared → info_signals_count = 1), hears the pitch, and passively agrees to a callback → callback_agreed = yes → Qualified (hot, score 90). Dealer B discloses his battery spec, monthly volume, current financier, and that rising prices mean he needs financing (info_signals_count = 4) → Qualified on substance alone, even without a callback. Dealer C’s call drops after he gives spec, volume, and a financing need (info_signals_count = 3) but before any callback → banded normally → Qualified, call_status = dropped_partial, tagged “resume” rather than cold-retried. Under the prior weighted model, Dealer A scored 30 (Cold) and was dropped.

Tuning principle

The band rule is the single point of change. Two optional one-line levers: (1) require at least one financing signal — existing_financier_shared, financing_need_expressed, or financing_value_acknowledged — for the substance path to Qualified, so purely operational disclosures (spec + volume only) land Warm; (2) raise or lower the info_signals_count threshold. Ship the threshold of 3 first, watch conversion, then tune.
